

# Embeddability of infinitely divisible probabilities on Lie groups

S. G. Dani

*Tata Institute of Fundamental Research, Mumbai*

There has been a longstanding conjecture that every infinitely divisible probability measure on a connected Lie group can be embedded in a continuous one-parameter convolution semigroup of probability measures on the group. This is known by now for a large class of groups but yet not in the generality it is expected. In the talk I will discuss the status of the conjecture, and some techniques involved in the study.
