1. Let $ABC$ be an acute-angled triangle and $CD$ be the altitude through $C$. If $AB = 8$ and $CD = 6$, find the distance between the midpoints of $AD$ and $BC$.

2. Prove that the ten’s digit of any power of 3 is even. [e.g. the ten’s digit of $3^6 = 729$ is 2].

3. Suppose $A_1 A_2 \ldots A_{20}$ is a 20-sided regular polygon. How many non-isosceles (scalene) triangles can be formed whose vertices are among the vertices of the polygon but whose sides are not the sides of the polygon?

4. Let $ABCD$ be a rectangle with $AB = a$ and $BC = b$. Suppose $r_1$ is the radius of the circle passing through $A$ and $B$ and touching $CD$; and similarly $r_2$ is the radius of the circle passing through $B$ and $C$ and touching $AD$. Show that

$$r_1 + r_2 \geq \frac{5}{8}(a + b).$$

5. Show that $19^{93} - 13^{99}$ is a positive integer divisible by 162.

6. If $a$, $b$, $c$, $d$ are four positive real numbers such that $abcd = 1$, prove that

$$(1 + a)(1 + b)(1 + c)(1 + d) \geq 16.$$ 

7. In a group of ten persons, each person is asked to write the sum of the ages of all the other 9 persons. If all the ten sums form the 9-element set $\{82, 83, 84, 85, 87, 89, 90, 91, 92\}$ find the individual ages of the persons (assuming them to be whole numbers of years).

8. I have 6 friends and during a vacation I met them during several dinners. I found that I dined with all the 6 exactly on 1 day; with every 5 of them on 2 days; with every 4 of them on 3 days; with every 3 of them on 4 days; with every 2 of them on 5 days. Further every friend was present at 7 dinners and every friend was absent at 7 dinners. How many dinners did I have alone?
