# Maximum sum contiguous subsequence

Let  $S$  be an array, such that  $S[i] \in \mathbb{R}$ . We want to find a contiguous subsequence of  $S$  with the maximum sum. The problem can be solved with the following recurrence.

$$S[i] = \max \{S[i - 1] + a[i], a[i]\} \forall i, 1 \leq i \leq n - 1$$

## Exercise

Find the indices  $k$  and  $\ell$ ,  $1 \leq k \leq \ell \leq n$ , such that  $\sum_{i=k}^{\ell} S[i]$  is maximum.

# Outline

- 1 Maximum sum contiguous subsequence

# Longest common subsequence (LCS)

Let  $A = \{a_1, a_2, \dots, a_n\}$  and  $B = \{b_1, b_2, \dots, b_m\}$  be two strings over an alphabet set  $\Sigma$ . A subsequence of  $A$  is of the form  $a_{i_1}, a_{i_2}, \dots, a_{i_k}$ , where each  $i_j$  is between 1 and  $n$  and  $1 \leq i_1 < i_2 < \dots < i_k \leq n$ . Let  $L[i, j]$  denote the length of the LCS of  $\{a_1, a_2, \dots, a_i\}$  and  $\{b_1, b_2, \dots, b_j\}$ . Then,  $L[i, j]$  can be expressed as

$$L[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0; \\ L[i - 1, j - 1] + 1 & \text{if } a_i = b_j, i, j > 0 \\ \max\{L[i - 1, j], L[i, j - 1]\} & \text{if } a_i \neq b_j, i, j > 0 \end{cases}$$

The final answer is  $L[n, m]$ .

## Exercise

Find the subsequences of  $A$  and  $B$  that achieve the LCS.

# Outline

- 1 Maximum sum contiguous subsequence

- 4 All pair shortest path
- 5 Knapsack

# Matrix chain multiplication

We have to find the matrix product

$\mathcal{M} = M_1 \times M_2 \times \cdots \times M_k \times M_{k+1} \times M_{k+2} \times \cdots \times M_n$ , where  $M_k$  is of size  $r_k \times r_{k+1}$ .

Let  $C[i, j]$  be the minimum cost of multiplying the matrices  $M_i \times \cdots \times M_j$  in terms of scalar multiplications. We denote  $M_i \times \cdots \times M_j$  as  $M_{i,j}$ . We can write  $M_{i,j} = M_{i,k-1} \times M_{k,j}$  for  $i < k < j$ .

$$C[i, j] = \min_{i \leq k \leq j} \{C[i, k-1] + C[k, j] + r_i r_k r_{j+1}\}$$

$C[1, n]$  is the final answer.

## Exercise

Find out how to compute  $C[i, j]$ .

# Outline

- 1 Maximum sum contiguous subsequence
- 2 Longest common subsequence
- 3 Matrix chain multiplication
- 4 All pair shortest path**
- 5 Knapsack

# All pair shortest path

Let  $G = (V, E)$  be a directed graph with weights on each edge. Let  $V = \{1, \dots, n\}$ . We want to find the distance among all vertices of  $G$ . Let  $i, j \in V$  and  $d_{ij}^k$  be the length of the shortest path from  $i$  to  $j$  that does not pass through  $\{k + 1, k + 2, \dots, n\}$ . So,  $d_{ij}^n$  is the final answer.

$$d_{ij}^k = \begin{cases} \ell[i, j] & \text{if } k = 0 \\ \min \left\{ d_{ij}^{k-1}, d_{ik}^{k-1} + d_{kj}^{k-1} \right\} & \text{if } 1 \leq k \leq n \end{cases}$$

# Outline

- 1 Maximum sum contiguous subsequence
- 2 Longest common subsequence
- 3 Matrix chain multiplication
- 4 All pair shortest path
- 5 Knapsack**

# Knapsack

Let  $U = \{u_1, \dots, u_n\}$  be a set of  $n$  items to be packed inside a knapsack of capacity  $C$ ,  $C \in \mathbb{Z}^+$ . For  $1 \leq i \leq n$ , let  $s_i$  and  $v_i$  be the size and value of the  $i$ -th item, where  $s_i, v_i \in \mathbb{Z}^+$ . We want to fill the knapsack with some items from  $U$  whose total size is at most  $C$  and the sum of the values of the items in the knapsack is maximized. Let  $V[i, j]$  denote the value obtained by filling a knapsack of size  $j$  with items taken from the first  $i$  items,  $\{u_1, \dots, u_i\}$  in an optimal way.

$$V[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ V[i - 1, j] & \text{if } j < s_i \\ \max \{V[i - 1, j], V[i - 1, j - s_i] + v_i\} & \text{if } i > 0 \text{ and } j \geq s_i \end{cases}$$

$V[n, C]$  is the final answer.

## Exercise

Find the subset of  $U$  that gives the optimal answer.
